**SPECIFICATIONS**

**GENERAL**

**Frequency Range**

160 meter band — 1.80 to 2.00 MHz  
 80 meter band — 3.50 to 4.00 MHz  
 40 meter band — 7.00 to 7.30 MHz  
 20 meter band — 14.00 to 14.35 MHz  
 15 meter band — 21.00 to 21.45 MHz  
 10 meter band — 28.00 to 28.50 MHz (A)  
                                   — 28.50 to 29.10 MHz (B)  
                                   — 29.10 to 29.70 MHz (C)  
 WWV — 15.0 MHz (receive only)

**Mode**

SSB (USB, LSB) or CW

**Antenna Impedance**

50 ~ 75 ohms

**Frequency Stability**

Within 100 Hz during any 30 minute period after warmup  
 Within ±1 kHz during the first hour after 1 minute of warmup

**Tubes and Semiconductors**

Tubes 3  
 Transistors 52  
 FETs 19  
 Diodes 100

**Power Requirements**

	120/220V AC 50/60 Hz operation	13.8V DC operation
Receive	45 watts (heaters on) 26 watts (heaters off)	5A (heaters on) 0.6A (heaters off)
Transmit	280 watts (maximum)	15A (maximum)

**Dimensions**

333 mm (13.2") wide  
 153 mm (5.9") high  
 335 mm (13.2") deep

**Weight**

16 kg (37.4 lbs.)

**TRANSMITTER**

**RF Input Power**

	120/220V AC, 50/60 Hz operation	13.8V DC operation
	200 watts PEP for SSB operation 160 watts DC for CW operation	120 watts PEP for SSB operation 90 watts DC for CW operation

**Carrier Suppression**  
**Sideband Suppression**  
**Spurious Radiation**  
**Microphone**  
**AF Response**

Better than 40 dB  
 Better than 50 dB  
 Better than 40 dB  
 High impedance microphone (50 k ohms)  
 400 to 2,600 Hz, within -6 dB

**RECEIVER**

**Sensitivity**  
**Selectivity**

0.25 μV S+N/N 10 dB or more  
 SSB — 2.4 kHz (-6 dB)  
           — 4.4 kHz (-60 dB)  
 CW\* — 0.5 kHz (-6 dB)  
           — 1.5 kHz (-60 dB)  
           \* (with optional CW filter installed)

**Image Ratio**  
**IF Rejection**  
**AF Output Power**  
**AF Output Impedance**

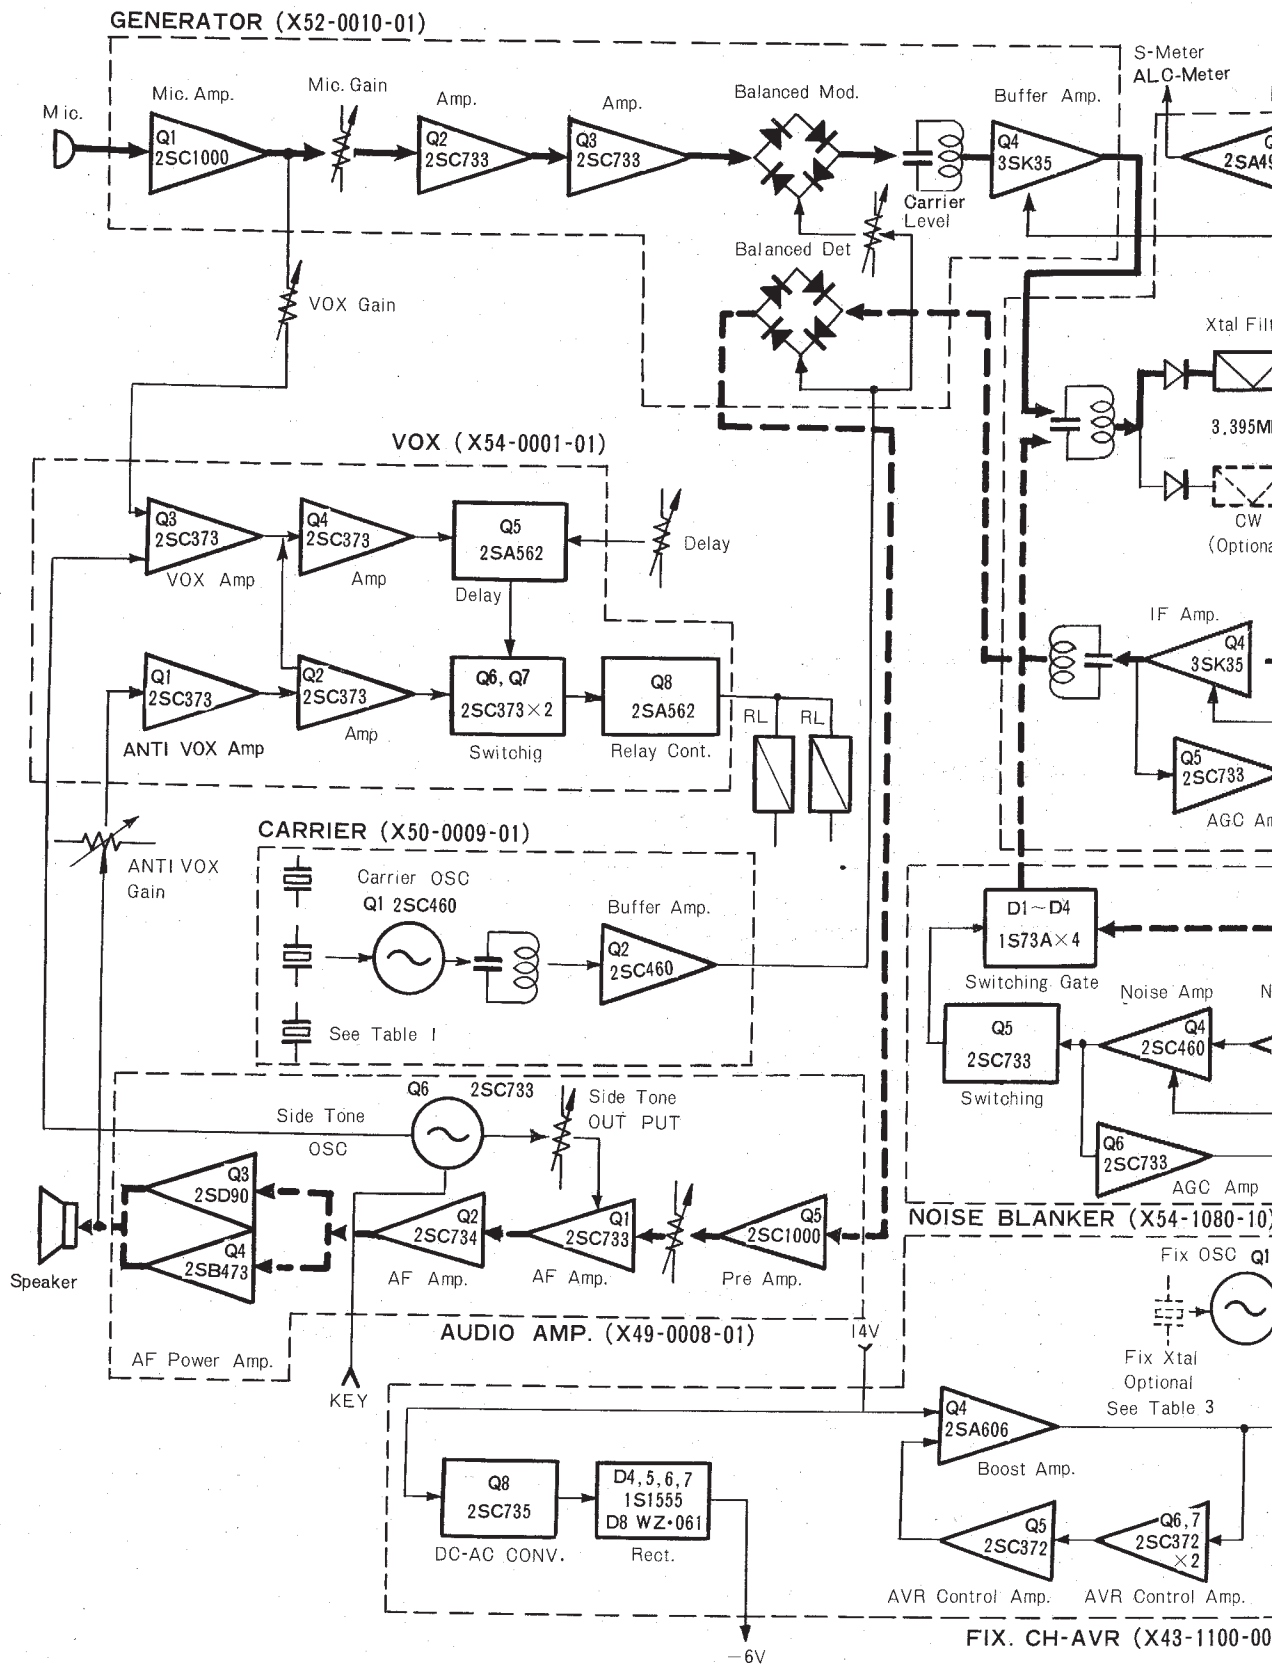

Better than 50 dB  
 Better than 50 dB  
 1 watt (8 ohms load, with less than 10% distortion)  
 40 to 16 ohms

## TS-520 SERIES COMPARATIVE TABLE

Item	Type	520	520S
Final unit		Hand wired	P.C.B. (X56-1200-00)
Digital display termination		By installing DK-520, DG-5 (Option) can be connected.	Built-in
1.8 MHz, AUX band		—	Built-in
RF ATT		—	Built-in
Speech processor		—	Built-in
Phone patch termination		—	Built-in
EXT REC ANT JACK		—	Built-in

### DK-520 OPTION TO TS-520

# BLOCK DIAGRAM

## GENERAL/CIRCUIT DESCRIPTION

### General

A block diagram of TS-520S is shown on page 5. The unit is composed of a transmitter and a receiver, each being of the filter type double-conversion system. The receiver has a first IF section (8.895 MHz to 8.295 MHz) and a second IF section (3.395 MHz). The unit contains a number of advanced accessory circuits and devices, such as a speech processor, RF NFB, 1.8 MHz and AUX bands, RF ATT, digital display terminal (for connection of DG-5 option and phone patch terminal, in addition to other circuits which are found in conventional transceivers.

### Circuit Description

#### Transmitter Section

The microphone signal is fed to the generator unit (refer to paragraph "Generator Unit" for operation of generator unit) and is amplified by the MIC amplifier. The signal is then converted to a DSB (Double Side Band) signal of 3.395 MHz and fed to the IF unit. The signal passes through the crystal filter and becomes a SSB signal.

The IF signal is mixed with the VFO signal by the 1st mixer and becomes the 2nd IF frequency of 8.895~8.295 MHz. This signal passes through the BPF and is fed to the RF unit. The signal is then converted to the transmit frequency, 1.8~28 MHz by Q1 3SK41(L) and is voltage amplified by the driver tube V1 12BY7A to drive the final tubes S2001A which deliver RF power to the ANT circuit.

#### Receiver Section

The receive signal of 1.8~28 MHz from the ANT terminal is converted to a 1st IF of 8.895~8.295 MHz through the RF unit and is fed to the IF unit. The signal passes through the BPF of the IF and is mixed with the VFO signal by Q9 that it becoming the 2nd IF frequency of 3.395 MHz. The signal then passes through the NB, returns to the IF, passing through the crystal filter, and is amplified before being fed to the generator unit. Finally, the signal is fed to the BD (balance detector) where it is converted to an AF signal. The AF signal is fed to the AF unit where it is amplified by Q1~4 to drive the speaker.

### 1. Carrier Unit (X50-0009-01)

This circuit functions as a carrier oscillator for the generator during transmission, and as a BFO for the ring detector during reception. The oscillator circuit Q1 (2SC460B) is of the Pierce B-E type; Q2 (2SC460B) functions as a buffer amplifier to provide stabilized output. Selection of oscillation frequency is accomplished by diode switch D1-D4 (1S1555 X 4).

When forward biased the diode internal resistance become low and an oscillator circuit is completed. Without forward bias, the diode resistance becomes high, and the crystal is disconnected, stopping oscillation. Frequencies are 3396.5 kHz for USB, 3393.5 kHz for LSB, and 3394.3 kHz (receive) and 3395.0 kHz (transmit) for CW.

### 2. Generator Unit (X52-1090-00)

This is the heart of the SSB transmitter, generating DSB signals during transmission. Voice signals fed to microphone are amplified by Q3 (2SC1000GR), Q5 (2SC733Y) and Q6 (2SC733Y) and then fed to the ring modulator (D1-D4), which suppresses the carrier component, passing only the DSB signal. The signal is amplified by the FET buffer amplifier Q1 and applied to the IF. The unwanted side band and carrier contained in DSB signals are further suppressed by the crystal filter in the IF unit to obtain a SSB signal. During CW operation, a DC voltage unbalances the ring modulator to obtain carrier output.

The processor is controlled by a switch on the front panel. Operating as a compressor circuit, the output of Q3 is further amplified by Q4 (2SC1000GR), Q8 (2SC30-0), Q9 (2SC733Y) and Q10 (2SC733Y) and is fed to Q5 through the diode switch controlled by the processor switch. The output of Q10 is phase inverted by Q11 (2SC945A) and rectified by a bridge rectifier consisting of 4 diodes. This signal is DC amplified by Q12 (2SC945R) to control the FET attenuator Q7 (2SK30-0) which utilizes pinch-off voltage. The required time constant is obtained at the output of Q12; in practice, 14 dB compression is obtained at 10 mV MIC input.

The MIC gain control is provided on the input side of Q5, so MIC gain can be set as desired independent of the processor switch position.

The unit also includes a receive ring demodulator and a transistor switching circuit Q2 (2SC460B) which disconnects carrier to the transmit ring modulator during reception.

## CIRCUIT DESCRIPTION

### 3. RF Unit (X44-1200-00)

Among the units contained in the TS-520S, this unit has the greatest number of functions. It is composed of a transmitter section, receiver section, ALC circuit and a bias control circuit.

#### WWV Receiving Section

The 15MHz WWV signal passes through the diode switch, interlocked with the band switch and is RF amplified by FET Q5 (2SK19GR) after being stepped up by T5. This signal is then converted into the 1st IF signal of 8.895 MHz by Q4 and fed to the band pass filter T2. The 1st local oscillator circuit is an overtone circuit consisting of Q8 whose power source voltage is stabilized by D3.

During WWV reception, power source voltage (14V) is not applied to the transmitter 2nd mixer Q1, receiver 1st mixer Q2 and the 1st local oscillator circuit.

#### ALC System

The ALC amplifier Q10 (2SC1515) features high breakdown voltage between collector, emitter and base. ALC voltage is produced when the grid current flowing into the S2001A's reaches about 30  $\mu$ A.

By setting the pull switch on the MIC/CAR VR to the NORM position, ALC voltage is fed back to the proceeding stage through the time constant circuit R72 and C59.

#### Control Section

Q11 is a switching transistor to cut off the transmitter 2nd mixer Q1 when the heater switch is OFF.

Normally, Q11 is cut off by the negative bias voltage (with respect to emitter) applied from -C line through a shunt resistor; the DC-DC converter stops oscillating when the heaters are switched OFF, and the base voltage of Q11 becomes zero and a forward bias (with respect to emitter) is applied, thereby the transistor turns ON. The bias resistor of the transmitter 2nd mixer Q2 is connected to the collector of Q11 to provide negative bias to the 1st and 2nd gates, thus Q1 is cut off.

During AC or DC operation, Q1 and V1 are block biased through either D8 or D9 when the heater switch is ON, thus Q1 and V1 are set in cut-off state.

#### Local Oscillator Circuit

A crystal oscillator circuit generates an oscillation frequency for each band. It functions as a 2nd local oscillator during transmission, and a 1st local oscillator during reception.

Crystals and oscillator coils are included in the OSC coil unit (X44-1160-00). Oscillation is effected by Q6 (2SK-19GR), while Q7 (2SC460B) functions as a buffer amplifier.

Non-adjustment oscillator circuit Q8 (2SC460B) is also included for WWV reception, the output of which is applied to Q4. Local oscillator output for the DG-5 digital display option appears through the buffer amplifier Q9 (2SC460B). The Drive (X44-1190-00), MIX (X44-1180-00), ANT (X44-1170-00), and OSC Coil Units (X44-1160-00),

function in conjunction with the RF unit. Coils, crystals and rotary switches are neatly arranged on printed circuit boards.

### 4. IF Unit (X48-1060-01)

This unit functions for both transmission and reception. During transmission, the DSB signal from the generator becomes a SSB signal while the unwanted side band and carrier are suppressed by the SSB crystal filter XF1. The SSB signal is IF amplified by Q1 (3SK35GR), which is common to transmission and reception, and is fed to the transmitter mixer Q2 (3SK35Y).

The local oscillator signal from the VFO unit is applied to G2 of Q2 while the cut-off frequency passes through the 7 MHz low pass filter (T10, T11, T12). The signal is mixed with the SSB signal at G1.

The converted 2nd IF signal is fed to the RF unit through the band pass filter. During transmission, the receiver IF amplifier Q3 (3SK35GR), Q4 (3SK35GR) and the receiver VFO mixer Q9 (3SK41L) are cut off by a negative voltage at the RB terminal.

During reception, the 1st IF signal from the RF unit is fed through the band pass filter to the VFO mixer Q9, where the signal is converted to the 2nd IF. This signal is fed through the IFT to the NB, and its output is applied through XF1 to the IF amplifier Q1.

The signal is then amplified by the 2-stage IF amplifier (Q3, Q4) and is fed to the ring detector of the generator. During reception, the transmitter VFO mixer Q2 is cut off by a negative voltage at the TBL terminal. Q5 (2SK19GR) and Q6 (2SK19GR) are AGC amplifiers. Q6 is used to select SLOW, FAST and OFF AGC and control RF GAIN.

A diode switch is provided on the input and output of the crystal filter so that the filter switches with the mode switch when the CW crystal filter YG-3395C (option) is installed. During transmission, Q7 (2SK19GR) and Q8 (2SA495Y) function as an ALC circuit. They also function as an S meter circuit during reception.

## CIRCUIT DESCRIPTION

### 5. NB (Noise Blanker Unit) (X54-1080-10)

The NB unit is divided into 2 circuits, a signal circuit and a noise amplifier and switch circuit.

In the signal circuit, the signal from the VFO mixer of the IF unit passes through the 3-stage IFT band pass filter and is amplified by Q1 (3SK22GR). The signal is then applied to the NBO terminal of the IF unit through the balanced blanking gate circuit.

In the noise amplifier, the noise signal amplified by Q2 (2SK19GR), Q3 (2SC460B), Q7 (2SC460B) and Q4 (2SC460B) is applied to the base of Q6 (2SC733Y) through the noise rectifier circuit consisting of D5 and D6 (1N60). The AGC time constant circuit Q6 has no effect on pulse noise; it functions for continuous, short-cycle signals such as SSB. Accordingly, Q3, Q4 and Q7 function in a state close to maximum gain for pulse noise, and function in a state of suppressed gain for continuous signals because of AGC voltage.

With the NB switch ON, the emitter of Q5 (2SC733Y) is grounded and when pulse noise is received, Q5 is turned ON. The blanking gate diodes connected to Q5 are reverse biased by the time constant circuit C7 and R3, thus the signal line is cut off to eliminate pulse noise.

### 6. AF Unit (X49-0008-01)

The AF unit contains a complementary OTL (Output Transformerless) audio frequency amplifier, semi-break-in circuit for CW operation, side tone oscillator circuit for monitoring and a detector circuit for calibration.

Q5 (2SC733Y) preamplifies the audio signal from the ring detector. High frequency components are cut by C15 and C18.

The signal is further amplified by Q1 and Q2 (2SC733Y) and then power amplified by Q3 (2SD90-0) and Q4 (2SB473C, D, N).

The side tone circuit functions only when the MODE switch is set to CW and the key connected to the KEY terminal is ON. This circuit uses a phase-shift oscillator at about 750 Hz. During transmission, Q5 is cut off by + voltage at the RL terminal.

When the optional DC-DC unit (DS-1A) is operated from a DC power source, the side tone circuit does not function if the H. SW is OFF, because the converter is also controlled by the heater SW, hence, the bias voltage of Q6 (2SC733Y) and the control voltage for the switching diode D3 (1S1555) are not generated. VR2 sets the output level of side tone.

### 7. VFO Unit (X40-1070-01)

The VFO frequency range is 5.5 MHz ("0" on the sub dial) to 4.9 MHz ("600" on the sub dial).

Q1 (3SK22Y) is a clapp oscillator, while Q2 (2SK19GR) provides buffered output. The use of a 1-stage RF filter,

and Darlington output Q3 and Q4 (2SC460B), provides stabilized operation against changes in load.

### 8. Marker Unit (X52-0005-01)

The 100 kHz crystal is energized by Q1 (2SC373).

Frequency is precisely adjusted by ceramic trimmer TC1 in the collector circuit.

Output of Q1 is shaped by diode D1 (1N60) to synchronize the multi-vibrator Q2 and Q3 (2SC373). The free running frequency of the multi-vibrator is approximately 25 kHz and is precisely synchronized to 25 kHz by Q1 output.

This signal is buffer amplified by Q4 (2SC373) to obtain the required output.

### 9. VOX Unit (X54-0001-00)

In SSB operation, voice signal from the MIC amplifier is fed to the MV terminal (side tone output in the case of CW operation). The signal is amplified by Q3 (2SC373), rectified by D6 (1N60) and becomes a DC signal proportional to the input signal.

When DC voltage from D6 is applied to the base of Q4 (2SC373), Q4 turns ON; as a result the voltage at the base of Q6 (2SC373) is decreased.

When Q4 is cut off during no-signal period, the base and emitter voltages of Q5 (2SA562Y) are equal, turning Q5 OFF therefore, C10 is charged through D7, the voltage being set by the DELAY VR. This turns Q4 and Q5 ON, discharging C10 through Q5. This action, repeated, represents VOX hold time.

Q6 and Q7 (2SC373) form a Schmidt circuit; when Q4 is OFF, Q6 is ON and Q7 is OFF. When Q4 is ON, Q6 is OFF and Q7 is ON, which, in turn, sets Q8 (2SA562Y) ON to operate the standby relay.

The ANTI VOX signal from the output of the AF unit is stepped up by T1 through the AV terminal and full-wave rectified by D1-D4 to cut off Q1 (2SC373).

When Q1 is OFF, C5 is charged through R4 and, at the same time, Q2 (2SC373) is turned ON, thus the base of Q4 is grounded; Q4 turns OFF to stop the operation of VOX.

## CIRCUIT DESCRIPTION/FUNCTIONAL DESCRIPTION

### 10. FIX CH, AVR Unit (X43-1100-00)

This unit includes a fixed channel crystal oscillator circuit, 9V AVR circuit and -6V DC-DC converter circuit. The crystal oscillator circuit Q1 (2SC460B) is a Pierce C-B circuit and its output is obtained from the Darlington buffer consisting of Q2 and Q3 (2SC460B). TC1-TC4 trimmers are provided for fine adjustment.

The 9V AVR circuit supplies power to the main oscillator and control circuits. Q4 (2SA606L) is a current regulator, Q5 and Q6 (2SC372) error voltage amplifiers, and Q7 (2SC372) is a temperature compensating transistor. D3 (WZ061) is the zener reference diode.

An oscillator circuit is formed by Q8 (2SC735Y) and T1 operating at approximately 400 Hz, which is rectified by D4-D7 (1S1555 X 4). A stabilized -6V source is obtained through zener diode D8 (WZ-061).

### 11. Rectifier Unit (X43-1090-02)

This unit contains all the rectifier circuits. In the S type transceiver, a voltage doubler delivers 800V half-wave rectifiers supply 300V, 200V and -C line, and a bridge rectifier 14V.

### 12. HV Unit (X43-1110-00)

This unit contains a voltage divider for plate voltage indication (HV) of the final amplifiers, a voltage divider to reduce screen voltage in TUNE, and a resistor to step down power to 50W during 28 MHz operation.

### 13. Indicator Unit (X54-1280-00)

FIX, VFO and RIT operation are indicated by light emitting diodes located above the sub-dial.

### 14. Final Unit (X56-1200-00)

The power amplifiers and all associated components other than the  $\pi$  match circuit are contained on the final printed circuit board.

## FUNCTIONAL DESCRIPTION

### Speech Processor Theory

In DX operation, the early model TS-520 changed ALC operation in 2 steps: to delay the rising ALC voltage and to shorten its release time so that the average power during SSB operation was increased. It offered reliable performance.

The TS-520S has a unique circuit which suppresses the spread of side bands and provides reliable function as a processor. In this speech processor, the MIC amplifier circuit has an AGC type compression amplifier. Because the time constant is relatively large, the amplifier has sufficient compression effect with minimum distortion. It also shortens the ALC time constant, which controls overall transmitter gain. This increases the average output power during SSB operation, without deteriorating signal quality. The circuit is designed to provide approximately 6 dB compression (at full scale ALC) at normal time constant, and about 20 dB (at 10 mV of MIC input) through the low frequency speech processor.

Fig. 1

### Speech Processor Operation

Referring to Fig. 2, the MIC AMP input is amplified to 50 mV by the MIC amplifier. Amplifier output will be saturated if the input level exceeds this limit. As shown in Fig. 2, the MIC amplifier output is saturated at approximately 70 mV when the processor is ON. The illustration also shows the output at processor ON and OFF cross at 10 mV input. This means these two outputs are equal at about 70 mV. The MIC AMP input level is adjustable up to approximately 30 mV without excessive distortion, by means of VR3 in the generator unit (X52-1090-00).

At processor ON the operating curve shifts toward the left from the OFF position. This shows the compression effect, which is adjustable within the range shown by means of VR2 in the generator unit. That is, MIC input can be amplified to approximately 70 mV by the compression amplifier. If more than 10 mV input is used, the MIC amplifier output

## FUNCTIONAL DESCRIPTION

Fig. 2

Fig. 3

is decreased at processor ON from the output level at processor OFF, if a microphone rated at less than 10 mV output is used, the MIC amplifier output is increased at processor ON. The relationship between MIC input and transmit output is shown in Fig. 3, that output is not increased at excessive MIC input, nor increased at maximum compression. Since semi-fixed resistors VR2 and VR3 are preadjusted, the MIC gain control is used to adjust the input level within the ALC zone.

In practical operation of the transceiver, sound quality will deteriorate if excessive input is applied, though this can be eliminated by using an attenuator between the microphone and the MIC input.

Excessive MIC input can be checked by the setting of the MIC control. As stated previously, the output level at 10 mV input is unchanged when the processor is turned ON

and OFF with the MIC control set at the center (12-o'clock) position, since the circuit is preadjusted.

The MIC input level is normal so long as the control is between 12 and 10 o'clock positions. If the control must be set below 10 o'clock, it indicates the MIC input is too high. In this state, the MIC amplifier output is attenuated when the processor is engaged. If the control is shifted toward the right of center, output is increased with the compressor ON.

Fig. 4

## FUNCTIONAL DESCRIPTION

### Intermodulation Characteristics

Low band 2-signal characteristic, as compared with high band, is such that there are many business use signal waves in the vicinity of amateur band and receiver gain can easily be obtained, thus deteriorating the 2-signal characteristic. The 2-signal characteristic is also deteriorated when a large input is present in non-linear operating stage such as the mixer stage of receiving circuit.

In a double conversion system, if the first mixer input level can be suppressed, the second mixer input can be maintained constant. Therefore, the first mixer input level for 1.9~21 MHz band is decreased by the C divider while the level for 28~29.1 MHz is maintained.

In the TS-520S, switching of the C divider and selection of converter power for WWV reception, and antenna circuits are accomplished by the rotary switch.

NOTES:

## PARTS LIST

### Note 1:

Except special types (example: cement, metal film, etc.) resistors are not detailed in the PARTS LIST. In regard to value, refer to the schematic diagram or the PC board illustration. Resistors not otherwise detailed are carbon type (1/4 or 1/8W).

Order carbon resistors according to the following example:

A carbon resistor's part number is RD14BY 2E222J.

1. Type of the carbon resistor

3. Resistance value

Significant figure    Multiplier

2. Wattage

1/4W → 2E  
1/8W → 2B

Example:

221 → 220Ω  
222 → 2.2kΩ  
223 → 22kΩ  
224 → 220kΩ  
225 → 2.2MΩ

4. Tolerance

J = ±5% (Gold)

K = ±10% (Silver)

### Note 2:

K: U.S.A.

W: Europe

T: Britain

### TOTAL

## DISASSEMBLY

### WARNING

LETHAL VOLTAGES ARE PRESENT WITHIN THE TS-520S. EXERCISE EXTREME CAUTION TO AVOID ELECTRIC SHOCK.

### 1. REPLACING THE RELAYS

#### (1) ANTENNA RELAY

RL2 is enclosed on the bottom of the final section. Remove the bottom case and then remove the relay shield box cover as shown in Figure 9. This relay has heavy contacts. Be sure to use a genuine replacement.

#### (2) VOX RELAY

RL1 is located below the VOX board, as shown in Figure 10, next to the power transformer. Remove the top cover of the transceiver and then remove the VOX board.

Fig. 9 Replacing RL2

Fig. 10 Replacing RL1, C15 and C16

### 2. REPLACING THE ELECTROLYTIC POWER SUPPLY CAPACITORS

(Figure 11) C19 and C20 are reached by removing the TS-520S top cover and then the FIXCH-AVR board. C15 and C16 are reached by removing the transceiver's top case and then the MARKER and VOX board (Figure 10).

Fig. 11 Replacing C19, 20

### 3. DISASSEMBLY OF THE COIL PACK

When service is required on the RF board or on any of the coil boards the coil pack must be taken apart as shown in Figure 12. The assembly includes the RF board, OSC COIL board, MIX COIL board, ANT COIL board, and the DRIVER COIL board.

	ℓ
Collar A	30mm
Collar B	25mm
Collar D	10mm

Fig. 12 Coil Pack Assembly

## DISASSEMBLY

1. Remove the top and bottom cover of the transceiver.
2. From the top, disconnect the leads between the wrap-terminals on the RF board and the COIL board to be removed.
3. Remove all of the front panel knobs and the front glass as shown on page 35.
4. Use a small hex nut driver to loosen the nuts at the front and back of the coil pack. The front nuts are reached through two holes in the front sub-panel on either side of the band switch. The front nut must be loosened to remove the OSC or MIX COIL boards. The back nuts must be loosened to remove the ANT or DRIVER coil boards.
5. The OSC COIL board can be removed by pulling the screw bars towards the rear panel. For the other boards, pull the screw bars out towards the front panel.

### 4. REMOVING THE VFO SECTION

1. Remove the front panel knobs, take off the transceiver's case, remove the front glass and pull off the front panel as shown in Figure 13.
2. Remove the FIXED CHANNEL · AVR board as shown in Figure 11.
3. Unplug the VFO output coax and the 2-pin power plug from the rear of the VFO case.
4. Unscrew the four countersunk screws (two on the top and two on the bottom) which hold the VFO to the front sub-panel (See Figure 14).
5. Gently lift and pull the VFO assembly from the chassis being very careful not to damage the sub-dial. Figure 13 shows the entire assembly.

Fig. 13 Exploded View of VFO and INDICATOR Unit

## DISASSEMBLY/MODIFICATION

Fig. 14 VFO Retainer

### 5. REPLACING THE DIAL LIGHTS

- 1) Remove the front panel.
- 2) Loosen the two screws of the indicator unit and lower it. (Figure 13.)

### 6. REPLACING THE METER LIGHTS

- 1) Loosen the two screws of the meter bracket.
- 2) Tilt the meter backward.

### 7. REMOVING THE METER

- 1) Remove the two screws of the meter bracket.
- 2) Remove seven screws from the IF unit and tilt the IF unit by 60° to the VFO.
- 3) Tilting the meter backward, remove upward.

Fig. 15 Removing the Meter

### 8. CHANGING PADDLE SWITCHES

Remove the TS-520S case. Remove all the knobs from the front panel and then remove the front glass and front panel. Take out the meter, as described in Section 7.

Pull the switch out towards the front of the transceiver while holding down the securing leaf spring as shown in Figure 16.

Push in a new switch from the front. The switch will secure itself by the leaf spring. The paddle itself can be replaced by levering off the old paddle with a screwdriver. Then push on the new paddle.

Fig. 16

### MODIFICATION TO 50W

- Remove L4 (150 mH) from the FINAL unit. (Figure 17)
- SG terminal is now supplied power from the FSB terminal of the HV unit, all bands and all modes.

Fig. 17

TROUBLESHOOTING

RECEPTION

# TROUBLESHOOTING

## RECEPTION

## TRANSMISSION

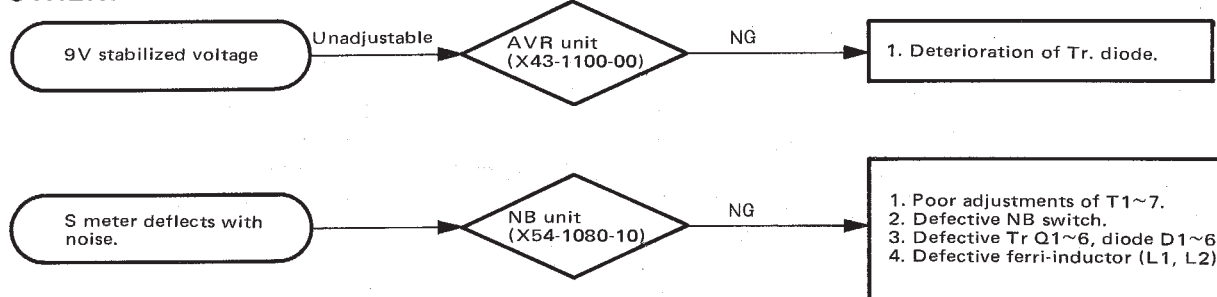

**TROUBLESHOOTING**

**TRANSMISSION**

**OTHERS**

## RECEIVER SECTION

1. The levels shown are signal generator output required for constant audio output with a constant AF gain control setting. Set the AF gain control for a .63v/8 ohm audio output for 0 dB signal generator input at 14.175 MHz.
2. Measure the AF output at the ring detector on the GENERATOR board.
3. All voltage measurements are read from an RF VTVM.
4. To measure the output of the signal generator, connect a .01  $\mu$ F, 500 WV capacitor between the signal generator and the voltmeter.

f MHz	A dB	B dB	C dB	D dB	E dB
1.8	-2	13	13	40	28
3.75	0	16	16	42	31
7.15	0	19	18	41	31
14.175	0	18	17	41	30
21.225	1	17	17	40	29
28.8	-1	13	13	34	27
JJY	1				

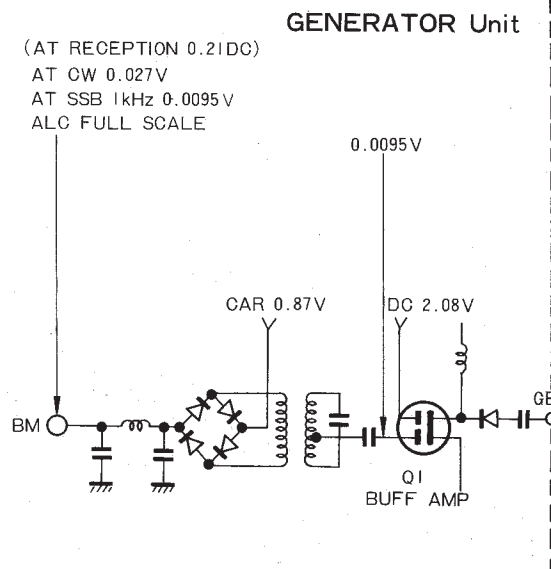

## TRANSMITTER SECTION

1. The levels shown are measured with an RF VTVM having an input capacitance of less than 3 pF.
2. All voltages at and before the first grid of the final tubes are measured with the rear panel SG switch turned off.

HET LEVEL (TP3)

BAND	(V)
1.8	1.65
3.5	1.40
7	1.45
14	1.35
21	1.45
28	1.30
28.5	1.35
29.1	1.40
JJY	0.17

## L DIAGRAM

## ADJUSTMENTS

### TEST EQUIPMENT REQUIRED

#### 1. Voltmeter

- 1) Input resistance: More than  $1M\Omega$
- 2) Voltage range: FS = AC/DC 1.5 to 1000V

#### 2. RF Vacuum-tube Voltmeter (RF VTVM)

- 1) Input impedance: More than  $1M\Omega$ , less than 20 pF
- 2) Voltage range: FS = 10 mV to 300V
- 3) Frequency range: Greater than 50 MHz

**Note:**

When special accuracy is not required during adjustment such as input level or oscillation output, a voltmeter or circuit tester may be substituted for RF VTVM by connecting it to the output of detector as shown in Fig. 19.

#### 3. AF Voltmeter

- 1) Frequency: 50 Hz to 10 kHz
- 2) Input resistance: More than  $1M\Omega$
- 3) Voltage range: FS = 10 mV to 30 V

#### 4. AF Generator (AG)

- 1) Frequency range: 200 Hz to 5 kHz
- 2) Output: Maximum 1 V

**Note:**

The AF generator should have low distortion.

#### 5. AF Dummy Load

- 1) Impedance:  $8\Omega$
- 2) Power: More than 3 W capability

#### 6. RF Dummy Load

- 1) Impedance: 50 to 75  $\Omega$
- 2) Power: Greater than 150 W rating
- 3) Frequency: 1.8 to 30 MHz

The above-mentioned instruments may be used for simplified adjustment. For precise adjustment, the following measuring instruments are additionally necessary.

#### 7. Oscilloscope

Select equipment that has as high sensitivity as possible and permits external synchronization.

#### 8. Slow Sweep Generator

- 1) Center frequency: 8.83 MHz
- 2) Frequency deviation: Maximum  $\pm 5$  kHz
- 3) Output voltage: More than 0.1 V
- 4) Sweep rate: At least 0.5 sec./cm

#### 9. SSG (Standard Signal Generator)

- 1) Frequency: 1.9 to 30 MHz
- 2) Output: 0 dB/ $\mu$ V ~ 120 dB/ $\mu$ V

**Note:**

Select equipment that is frequency stable during non-modulation and having a minimum level of frequency modulation.

#### 10. Frequency Counter

- 1) Minimum input voltage: 50 mV
- 2) Frequency range: More than 40 MHz

#### 11. Noise Generator

Select equipment that generates ignition-like noise containing high harmonics to 30 MHz or higher.

#### 12. Directional Coupler

### RECEIVING SECTION

#### 1. General

Place the unit on its side, with both covers removed, finals up. Be certain that the air supply to the final tubes is not blocked.

##### (1) Initial Settings

##### 1) Front panel

MODE	USB
FUNCTION	FIX
RF GAIN	MAX
H. SW	OFF
VOX	MAN
AGC	FAST
NB	OFF
RIT	OFF
BAND	14
STBY	REC
POWER	ON

##### 2) Rear panel

SG SW	OFF
REC ANT	NORMAL
X VERTER	OFF

##### (2) Rear Panel

Connect an  $8\Omega$  dummy load to SPEAKER jack.

#### 2. Setting the 9V Power Supply and FET Bias Voltage

##### (1) Test Equipment

- 1) Voltmeter

##### (2) Adjustments

Connect the voltmeter to terminal 9 on the FIX. CH-AVR board. Adjust VR1 for a voltage reading of 9 volts  $\pm 0.2$  volts. Next connect the voltmeter to terminal RF-1 on the FIX. CH-AVR board. Adjust VR3 for a reading of 3.3 volts  $\pm 0.1$  volt.

## ADJUSTMENTS

### 3. Band Pass Filter Adjustment

#### (1) Test Equipment

- 1) Sweep generator (Marker frequency 8.295 MHz, 8.595 MHz, 8.895 MHz required.)
- 2) Detector (See Fig. 19.)
- 3) Oscilloscope

#### (2) Adjustment

- 1) B.P.F. for reception  
See Figure 18 for the test setup. After all of the connections described in Figure 18 have been made for the receiver adjustment, tune T2, T3 on the RF board, and T8 on the IF board for the waveform shown in Figure 20.

**Note:**

VFO and FIX. CH (If installed) must be off.

Fig. 18 B.P.F. for Reception

Fig. 19 Detector

Fig. 20

- 2) B.P.F. for transmission

Now make the connections for transmission as shown in Figure 21. Set the standby switch to SEND and adjust T3 and T4 on the IF board and T1 on the RF board for the waveform shown in Figure 20. Return the standby switch to REC.

**Note:**

VFO and FIX. CH (If installed) must be off.

Fig. 21 B.P.F. for TRANSMISSION

### 4. Carrier Board Adjustment

#### (1) Test Equipment

- 1) RF VTVM

#### (2) Adjustment

Connect the VTVM to the OUT terminal on the CARRIER board. Set the FUNCTION switch to VFO and adjust T1 on the CARRIER board for maximum voltage.

**Note:**

The carrier can not be adjusted when the FUNCTION switch is turned to CAL-FIX or CAL-RMT.

### 5. Coil Pack Alignment

#### (1) Test Equipment

- 1) RF VTVM
- 2) SSG
- 3) AF VTVM

#### (2) Adjustment

- 1) HETERODYNE OSCILLATOR COILS

Connect the RF VTVM to terminal TP3 on the RF board. For the 1.8 MHz band adjust the 1.8 MHz oscillator coil for a maximum reading on the VTVM. Then turn the core counterclockwise for a voltage reading 1 db lower than the maximum. Repeat the same procedure for the 3.5, 7, 14, 21, and 28.5 MHz bands.

# ADJUSTMENTS

## 2) ANTENNA AND MIXER COILS

Set the FUNCTION switch to VFO, remove the VTVM, and connect the signal generator to the ANTENNA connector. Turn the DRIVE control to the 12 o'clock position. Table 1 below describes the adjustment order and frequencies for this alignment. Receive the signal generator output at the designated frequency and carefully adjust the appropriate ANTENNA then MIXER coil for a maximum S-meter reading. The signal generator output should start at 60 dB and be reduced as the circuit sensitivity increases.

Adjusting order	B A N D	Adjusting frequency
1	1.8	1.9 MHz
2	28.5	28.8 MHz
3	21	21.225MHz
4	14	14.175MHz
5	7	7.15 MHz
6	3.5	3.75 MHz

Table 1

**Note 1:**

ADJUSTMENT order of Table 1 should be keep. If not, adjustment can't be made.

1.8 MHz ANT coil should be tuned at the point the core is deep in the form.

The other coil core should be tuned at the top position.

**Note 2:**

The coil cores are fragile. Tune them carefully from straight above. Be certain to tune the correct coil for each band.

## 3) DRIVE COILS

**CAUTION** Disconnect SSG.

Turn the H.SW switch ON, MODE switch to CW, set the METER switch to ALC, adjust the CAR control to maximum, and set the standby switch to SEND. Adjust each coil, in order and at the frequencies described in Table 1, for maximum ALC deflection. Reduce the CAR control as necessary. After adjustments, set the STBY SW to REC.

**Note 1:**

In this adjustments, set SG SW to OFF.

**Note 2:**

**CAUTION**

SSG output should not be connected to ANT terminal or damage to the SSG attenuator will occur.

**Note 3:**

1.8 MHz ANT coil should be tuned at the point the core is deep in the form.

The other coil cores should be tuned at the top positions.

## 6. WWV Circuit Alignment

### (1) Test Equipment

- 1) SSG

### (2) Adjustments

Insert a 15 MHz, 60 dB signal into the ANTENNA connector and push the WWV switch on. Set the main tuning dial to zero to receive the signal. Adjust coils T4 and T5 on the RF board for a maximum S-meter reading. Reduce the signal input as necessary. Adjust coil T3 for a maximum S-meter reading. Decrease SSG output with the rise in sensitivity.

## 7. IFT Adjustment

### (1) Test Equipment

- 1) SSG
- 2) Tester

### (2) Adjustments

Insert a 40 dB signal into the transceiver at 14.175 MHz USB. Tune IF transformers T2, T5, T6, and T9 on the IF board (X48-1060-01) for a maximum S-meter reading. Then adjust IF transformers T1 ~ 5 on the NB board (X54-1080-10) for a maximum S-meter reading. Figure 22, 23 show the coil locations.

**Note:**

Repeat the adjustments several times because of coil interaction. Set the signal generator to 60 db and connect a voltmeter to the collector of Q6 on the NB board. Adjust NB IF coils T6 and T7 to minimize the voltage at the collector of Q6.

Fig. 22

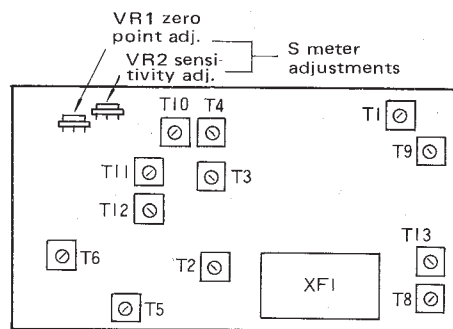

Fig. 23

## ADJUSTMENTS

### 8. Trap Coil Adjustment

#### (1) Test Equipment

- 1) SSG
- 2) AF VTVM

#### (2) Adjustments

##### 1) 8 MHz IF TRAP

Set the BAND switch to 7 MHz and insert an 8.895 MHz signal (70 dB) at the ANTENNA connector. Tune the receiver to 7.0 MHz and adjust T7 on the RF board (X44-1080-00) for a minimum S-meter reading.

Set the signal generator to 8.395 MHz and receive it at the VFO dial setting "500". Adjust T6 on the RF board to minimize the S-meter reading. Repeat this adjustment two or three times.

##### 2) 3.5 MHz TRAP

Turn the BAND switch to 3.5, turn the receiver to 3.7 MHz and adjust the DRIVE control for maximum sensitivity. Connect an AF VTVM and an 8 ohm dummy load to the EXT. SPEAKER jack. Insert a 3.736 MHz signal from the signal generator to the ANTENNA connector, tune to it with the VFO, and adjust trap coil T13 on the IF board for a minimum voltage reading on the AF VTVM.

### 9. Carrier Balance

#### (1) Test Equipment

- 1) SSG
- 2) AF VTVM

#### (2) Adjustments

Tune the TS-520S to receive the signal generator input (20 dB) at 14.175 MHz and adjust the DRIVE control for maximum sensitivity. Connect the AF VTVM and an 8 ohm dummy load to the EXT. SPEAKER jack. Adjust TC2 (on the GENERATOR board) for maximum reading on the AF VTVM.

### 10. S-Meter Adjustment

#### (1) Test Equipment

- 1) SSG

#### (2) Adjustments

Turn the RF gain control fully clockwise, receive the signal generator input at 14.175 MHz (40 dB), and tune the DRIVE control for maximum sensitivity. With no signal, adjust VR1 on the IF board (X48-1060-01) to zero the S-meter. Then with a 40 dB signal to the ANTENNA connector at 14.175 MHz, adjust VR2 on the IF board for an S9 meter reading.

### 11. RIT Adjustment

#### (1) Test Equipment

None.

#### (2) Adjustments

- 1) Set the RIT control to accurate zero point.
- 2) Push the RIT switch on.
- 3) Turn the FUNCTION switch to CAL-25 kHz and receive a calibrator signal at 1 kHz beat frequency.
- 4) Push the RIT switch off and adjust VR2 on the FIX CH. AVR unit for the same 1 kHz beat established with the RIT on.  
Switch the RIT on and off several times to be certain that the two tones are identical.

### 12. Calibrator Frequency Adjustment

#### 12-1 Frequency Counter used.

##### (1) Test Equipment

- 1) Frequency counter

##### (2) Adjustments

Connect a frequency counter to terminal MO of the MARKER board. Set the FUNCTION switch to CAL-25 kHz and adjust TC1 on the MARKER board for a frequency counter reading of an even 25 kHz ( $\pm 2$  Hz).

#### 12-2 WWV Circuit used.

##### (1) Test Equipment

None.

##### (2) Adjustments

Connect an antenna to the transceiver and receive WWV at 15 MHz. Set the FUNCTION switch to CAL-25 kHz to turn on the calibrator. Adjust TC1 to bring the calibrator and WWV to zero beat.

### 13. VFO Adjustments

#### (1) Test Equipment

- 1) RF VTVM
- 2) Frequency counter

#### (2) Adjustment

##### Adjustment of OSC frequency

Set the FUNCTION switch to VFO and connect a frequency counter to the VFO terminal on the IF board (X48-1060-01). With the VFO tuned to zero the frequency counter should read 5.5 MHz. If the frequency is not correct, adjust TC1 (inside the VFO section) as shown in Figure 24 for correct frequency output. Tune the VFO to the 600 mark and check that the frequency counter shows 4.9 MHz. If the frequency is incorrect, adjust L1 in the VFO section for proper frequency. Repeat the adjustment of TC1 and L1 alternately several times to insure proper operation.

# ADJUSTMENTS

## Adjustment of Output Voltage

To adjust the VFO output, set the VFO to 300, connect an RF VTVM to terminal V on the IF board, and adjust TC2 in the VFO section for a 1.0 volt reading.

Fig. 24

## TRANSMITTER SECTION

### 14. Final Bias Current Adjustments

(1) Test Equipment

None.

(2) Adjustments

- H · SW: ON
- MODE: USB or LSB
- MIC VR: Full counter clockwise
- Meter SW: IP
- SG. SW ON

Set STBY SW to SEND and adjust BIAS VR for 60 mA IP. After adjustments, return STBY SW to REC.

### 15. IFT Adjustment

(1) Test Equipment

50Ω dummy load.

(2) Adjustments

Slide the SG switch off, turn the MODE switch to CW, set the METER switch to ALC, and turn the CAR control fully clockwise. Tune the transmitter section at 14.175 MHz. The DRIVE control should be at 12 o'clock. Set the standby switch to SEND and adjust T1 on the GENERATOR board for a maximum ALC meter reading. Reduce the CAR control as necessary.

### 16. RF Meter, Power Check, and Neutralization Adjustment

(1) Test Equipment

- 1) Power meter (more than 150W) or dummy load
- 2) RF VTVM

(2) Adjustments

#### RF Meter

Tune the TS-520S for operation at 14.175 MHz into a dummy load through a wattmeter with the SG switch on. Set the meter switch to ALC and the CAR control to about 12 o'clock. With the MODE switch at TUN, transmit at 14.175 MHz and adjust the DRIVE control for a maximum ALC meter reading. Turn the METER switch to IP and tune the PLATE control to minimize the meter reading. Set the MODE switch to CW, turn the METER switch to RF, and tune the PLATE and LOAD controls alternately for maximum output power as indicated on the wattmeter. After the transceiver is tuned, adjust the side panel RF VOLT control for an RF meter reading of about 250 mA (on the IP scale). (The RF meter position does not have a separate scale.) Return the standby switch to REC.

#### Neutralization

Tune the TS-520S for maximum output on CW at 21.3 MHz with the SG switch on. Set the standby switch to REC and slide the SG switch off. Connect the RF VTVM to the ANTENNA connector along with the dummy load, and flip the standby switch to SEND. With an insulated tuning tool, tune TC1 in the final section for a minimum reading on the VTVM.

Now tune the TS-520S for maximum CW output with the SG switch on. Check the power output at 3.75 MHz, 7.15 MHz, 14.175 MHz, 21.225 MHz. Verify with the wattmeter on each band that the output power is more than 80 W. At 28.3 MHz, 28.8 MHz, 29.4 MHz be sure that the output power is more than 50W.

#### Note:

Be sure that the PLATE is dipped, or max. RF is shown, while still in the tune position.

## ADJUSTMENTS

### 17. Balanced Modulator and Carrier Adjustment

#### (1) Test Equipment

- 1) Power meter
- 2) AF VTVM
- 3) AF generator
- 4) RF VTVM
- 5) Frequency counter

#### (2) Adjustments

Tune the TS-520S for maximum CW output at 14.175 MHz through the wattmeter into a dummy load. Set the MODE switch to LSB, connect an RF VTVM to the ANTENNA connector and adjust TC1 and VR1 alternately on the GENERATOR board for a minimum reading on the RF VTVM. Switch the MODE switch to USB and readjust TC1 and VR1 for an RF VTVM reading equal to the reading for LSB.

Disconnect the RF VTVM, set the MODE switch to LSB, and insert a 1500 Hz (5 mV) signal at the MIC connector. Adjust the MIC control for an output of 50 watts. Switch the AF input to 400 Hz and, if necessary, adjust TC3 (on the CARRIER board) for output within 5 watts of the output for 1500 Hz.

Switch the AF input to 2600 Hz and, if necessary, adjust TC3 for output within 5 watts of the output power for 1500 Hz.

Turn off the SG switch and connect a frequency counter to the OUT terminal on the CARRIER board, and set the MODE switch to CW. Set the standby switch to SEND and adjust TC1 on the CARRIER board to obtain an oscillator frequency of 3.395 MHz.

### 18. Sidetone Output Adjustment

#### (1) Test Equipment

- 1) AF VTVM
- 2) Key

#### (2) Adjustments

Slide the SG switch off and connect the key to the TS-520S. Set the MODE switch to CW and the AF gain control to 12 o'clock. Connect the AF VTVM to the EXT. SPEAKER jack, the key the transceiver, and adjust VR1 on the AF board for a reading of approximately 50 mW (0.63 V/8 ohms).

### 19. Processor Adjustments

#### (1) Test Equipment

- 1) AF VTVM
- 2) AG

#### (2) Adjustments

Connect the AF VTVM to the MAO terminal of the GENERATOR unit. Apply 10 mV, 1 kHz AG signal to the MIC terminal with the processor SW off. Turn PROCESSOR SW on and adjust VR3 on the GENERATOR unit to obtain equal output level with that of the PROCESSOR off.

With the PROCESSOR SW on, decrease the AG output to 1 mV (-20 dB), and adjust VR2 for -6 dB output at the MAO terminal.

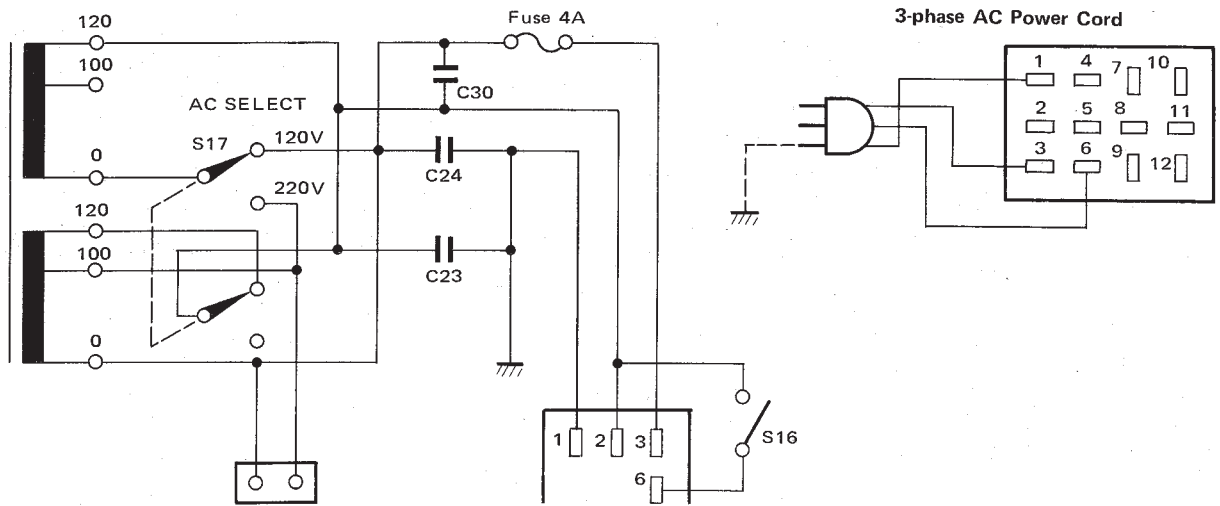

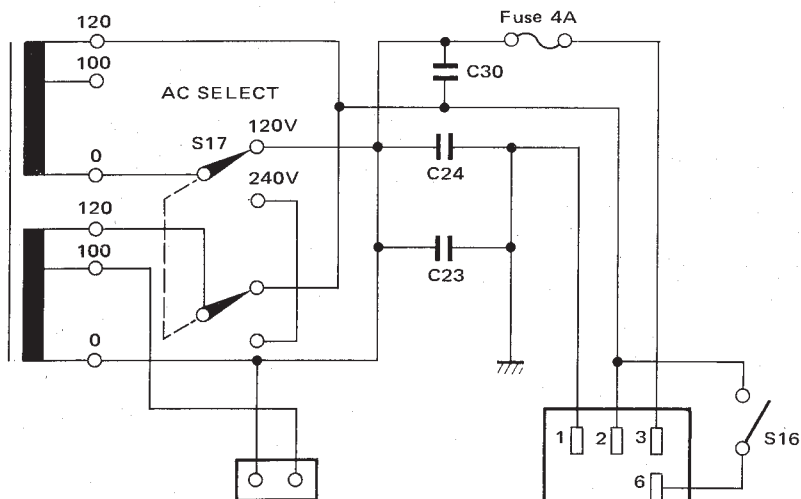

Fig. 25 GENERATOR Unit (X52-1090-00)
